

Natural Language Processing

Introduction, course logistics. Part 2

Yulia Tsvetkov

yuliats@cs.washington.edu

Yulia Tsvetkov

Syllabus https://courses.cs.washington.edu/courses/cse447/22sp/

• Introduction

- Overview of NLP as a field
- Modeling (ML fundamentals)
 - Text classification: linear models (perceptron, logistic regression), non-linear models (FF NNs, CNNs)
 - Language modeling: n-gram LMs, neural LMs, RNNs
 - Representation learning: word vectors, contextualized word embeddings, Transformers
- Linguistic structure and analysis (Algorithms, linguistic fundamentals)
 - Words, morphological analysis,
 - Sequences: part of speech tagging (POS), named entity recognition (NER)
 - Syntactic parsing (phrase structure, dependencies)
- Applications (Practical end-user solutions, research)
 - Sentiment analysis, toxicity detection
 - Machine translation, summarization
 - Computational social science
 - Interpretability
 - Fairness and bias

Course structure

please read the syllabus

https://courses.cs.washington.edu/courses/cse447/22sp/

Readings

- <u>https://github.com/jacobeisenstein/gt-nlp-class/blob/master/notes/eisenstein-nlp-notes.pdf</u>
- https://web.stanford.edu/~jurafsky/slp3/ed3book.pdf
- +additional readings posted weekly Yulia Tsvetkov

Course website

- <u>https://courses.cs.washington.edu/courses/cse447/22sp/</u>
- Office hours, announcements, calendar, etc.

Deliverables & grading

• Homework projects - 90%

- 3 programming assignments, 30% each
- "Semi-autograded" Most of the grades (~80%) come from replicating reference outputs in a given Jupyter notebook. You would usually know this part of your grades before submitting your assignments. The rest of the grades would involve things like write-ups, algorithm performance on hidden test sets, etc.
- We'll discuss the setup in detail in the next lecture
- **Quizzes** 10%
 - 8 simple quizzes on Wednesdays
 - 10 minutes in the beginning of the class
 - Starting from the 3rd week
 - 5 best quizzes, 2% each
- Participation in course discussions 10% bonus
 - Respond to HW questions and discussions from your classmates
 - Contribute "insightful" discussions on Ed 5% extra credit per 3 responses (10% max)

Homework assignments

• Project 1: Text classification

- We will build a system for automatically classifying song lyrics comments by era.
 Specifically, we build machine learning text classifiers, including both generative and discriminative models, and explore techniques to improve the models.
- Project 2: Sequence labeling
 - We focus on sequence labeling with Hidden Markov Models and some simple deep learning based models. Our task is part-of-speech tagging on English and Norwegian from the Universal Dependencies dataset. We will cover the Viterbi algorithm which could require a little bit prior knowledge of dynamic programming.
- Project 3: Dependency parsing
 - We will implement a transition-based dependency parser. The algorithm would be new and specific to the dependency parsing problem, but the underlying building blocks of the method are still some neural network modules covered in P1 and P2.

Homework submission

- Submit via Gitlab
 - We will pull your code for submission (with an assignment tag) and check the commit time.
 - A detailed grading rubric would be specified in the main Jupyter notebook of each assignment.
- Late policy
 - Each student will be granted **5 late days** to use over the duration of the quarter.
 - You can use a maximum of 3 late days on any one project.
 - Weekends and holidays are also counted as late days.
 - Late submissions are automatically considered as using late days.
 - Using late days will not affect your grade.
 - However, projects submitted late after all late days have been used will receive no credit. Be careful!

Communications with instructors

- You should be able to see yourselves be added to the Ed discussion board of CSE 447 / CSE M 547 22 sp. Please contact the staff if you are not.
- **Discussion Board (EdSTEM)** will be used to answer questions related to lectures and assignments
 - We really encourage you to ask/discuss higher level questions on the discussion board.
 - We encourage that generic questions should be posted as "Public" so that other classmates would also got benefited from it.
 - Please do not post detail about your solutions (detail ideas, codes, etc.) on public threads. Private discussion should be used for these posts.
- For grading issues, please email the instructor team directly.

Class participation

- Lectures and homework assignments complement each other
- Lecture materials are broader
- Homework assignments will go deeper into three important topics
- Try to attend the lectures
- Quizzes are designed to encourage you to do so
- But if you miss a lecture you can watch a recording, or read assigned book chapters
- Participate in class discussions, 10% bonus is an incentive
 - But don't just provide code solutions to questions on homework projects
 – those are for individual work!
 - Provide insights, theoretical background, references to readings
- Your questions are always welcome!

Office hours

- Yulia Thu 3:30 4:30pm @ zoom https://washington.zoom.us/j/92241001365 (and by appointment)
- Han Mon 11am-12pm @ zoom (<u>https://washington.zoom.us/my/xhan77</u>)
- Thai Tues 2:00 3:00pm @ Zoom (Zoom ID on Canvas)
- Ivy Wed 4:30-5:30pm (<u>https://washington.zoom.us/my/ivyguo</u>)
- Kaiser Thu 12:30pm 1:30pm @ zoom (https://washington.zoom.us/j/98344959831)
- Leroy Fri 11:30am 12:30pm (https://washington.zoom.us/my/lrywng)

- Teaching sections
 - We'll announce when we will have a teaching section
 - Not held by default

Quizzes

- 8 quizzes, students can drop 3
- Each quiz has 5 simple multiple-choice questions, autograded
- Quizzes are on Canvas, open during the lecture time
- Quiz time 10 minutes in the beginning of the class
- Starting from the 3rd week
- Grading on 5 best quizzes, 2% each

More course logistics

We care that you learn!

Your questions are always welcome.

Questions?

https://courses.cs.washington.edu/courses/cse447/22sp/

What does it mean to "know" a language?

What does an NLP system need to 'know'?

• Language consists of many levels of structure

• Humans fluently integrate all of these in producing/understanding language

• Ideally, so would a computer!

Speech, phonetics, phonology

This is a simple sentence . / δis iz θ 'simpl 'sentens /.

هذه جملة بسيطة

đây là một câu đơn giản

यह एक साधारण वाक्य है

This is a simple sentence . / ðis iz ə 'simpl 'sɛntəns /.

Words, morphology

- Morphological analysis
- Tokenization
- Lemmatization

Morphology

Tokens This is a simple sentence .

be

3sg

present

Syntax

Syntax

speech

phonetics

text

orthography

Semantics

- Named entity recognition
- Word sense disambiguation
- Semantic role labelling

Discourse

Why is language interpretation hard?

- 1. Ambiguity
- 2. Scale
- 3. Variation
- 4. Sparsity
- 5. Expressivity
- 6. Unmodeled variables
- 7. Unknown representation \mathcal{R}

Ambiguity: word sense disambiguation

Ambiguity

- Ambiguity at multiple levels:
 - Word senses: **bank** (finance or river?)
 - Part of speech: **chair** (noun or verb?)
 - Syntactic structure: I can see a man with a telescope
 - Multiple: I saw her duck

Semantic analysis

• Every language sees the world in a different way

• For example, it could depend on cultural or historical conditions

- Russian has very few words for colors, Japanese has hundreds
- Multiword expressions, e.g. happy as a clam, it's raining cats and dogs or wake up and metaphors, e.g.
 love is a journey are very different across languages

Yulia Tsvetkov

Why is language interpretation hard?

- 1. Ambiguity
- 2. Scale
- 3. Variation
- 4. Sparsity
- 5. Expressivity
- 6. Unmodeled variables
- 7. Unknown representation \mathcal{R}

Scale

- ~7K languages
- Thousands of language varieties

MOROCCO LIBYA Arabic ghay CHAD Hausa SUDAN mharic Yoruba Ispo Oromo SOMALIA EQUATORIAL OTTAKA SAD TOME AND PREVETE ingals. Conge **NENCHILLES** 0 Afro Asiatic 😑 Nilo Saharan Niger Congo A Niger Congo B (Bantu) Khoisan Austronesian

Africa is a continent with a very high linguistic diversity: there are an estimated 1.5-2K African languages from 6 language families. **1.33 billion people**

Englishes

NLP beyond English

- ~7,000 languages
- thousands of language varieties

Tokenization

这是一个简单的句子

WORDS This is a simple sentence

זה משפט פשוט

Tokenization + disambiguation

in tea	
her daughter	

בתה

• most of the vowels unspecified

in tea	בתה
in the tea	בהתה
that in tea	שבתה
that in the tea	שבהתה
and that in the tea	ושבהתה

ושבתה

and her saturday	ו+שבת+ה
and that in tea	ו+ש+ב+תה
and that her daughter	ו+ש+בת+ה

- most of the vowels unspecified
- particles, prepositions, the definite article, conjunctions attach to the words which follow them
- tokenization is highly ambiguous

Tokenization + morphological analysis

• Quechua

Much'ananayakapushasqakupuniñataqsunamá

Much'a -na -naya -ka -pu -sha -sqa -ku -puni -ña -taq -suna -má

"So they really always have been kissing each other then"

Much'a	to kiss
-na	expresses obligation, lost in translation
-naya	expresses desire
-ka	diminutive
-pu	reflexive (kiss *eachother*)
-sha	<pre>progressive (kiss*ing*)</pre>
-sqa	declaring something the speaker has not personally witnessed
-ku	3rd person plural (they kiss)
-puni	definitive (really*)
-ña	always
-taq	statement of contrast (then)
-suna	expressing uncertainty (So)
-má	expressing that the speaker is surprised

Tokenization + morphological analysis

• German

Infektionsschutzmaßnahmenverordnung

Multilingual NLP

- Levels of linguistic structure
- Categorization of languages and processing of linguistic structures across languages
- Multilingual modeling

NLP Technologies/Applications

Why is language interpretation hard?

- 1. Ambiguity
- 2. Scale
- 3. Variation
- 4. Sparsity
- 5. Expressivity
- 6. Unmodeled variables
- 7. Unknown representation \mathcal{R}

Linguistic variation

Non-standard language, emojis, hashtags, names

chowdownwithchan #crab and #pork #xiaolongbao at @dintaifungusa... where else? 😂 🕸 Note the cute little crab indicator in the 2nd pic 🙀 💞

Variation

• Suppose we train a part of speech tagger or a parser on the Wall Street Journal

• What will happen if we try to use this tagger/parser for social media??

@_rkpntrnte hindi ko alam babe eh, absent ako kanina I'm sick rn hahaha 😌 🙌

Why is language interpretation hard?

- 1. Ambiguity
- 2. Scale
- 3. Variation
- 4. Sparsity
- 5. Expressivity
- 6. Unmodeled variables
- 7. Unknown representation \mathcal{R}

Sparsity

Sparse data due to Zipf's Law

- To illustrate, let's look at the frequencies of different words in a large text corpus
- Assume "word" is a string of letters separated by spaces

Word Counts

Most frequent words in the English Europarl corpus (out of 24m word tokens)

any	word		nouns			
Frequency	Token	Frequency	Token			
1,698,599	the	124,598	European			
849,256	of	104,325	\mathbf{Mr}			
793,731	to	92,195	Commission			
640,257	and	66,781	President			
508,560	in	62,867	Parliament			
407,638	that	57,804	Union			
400,467	is	53,683	report			
394,778	a	53,547	Council			
263,040	Ι	45,842	States			

Word Counts

But also, out of 93,638 distinct words (word types), 36,231 occur only once. Examples:

- cornflakes, mathematicians, fuzziness, jumbling
- pseudo-rapporteur, lobby-ridden, perfunctorily,
- Lycketoft, UNCITRAL, H-0695
- policyfor, Commissioneris, 145.95, 27a

Plotting word frequencies

Order words by frequency. What is the frequency of nth ranked word?

Zipf's Law

Implications

- Regardless of how large our corpus is, there will be a lot of infrequent (and zero-frequency!) words
- This means we need to find clever ways to estimate probabilities for things we have rarely or never seen

Why is language interpretation hard?

- 1. Ambiguity
- 2. Scale
- 3. Variation
- 4. Sparsity
- 5. Expressivity
- 6. Unmodeled variables
- 7. Unknown representation ${\cal R}$

Expressivity

Not only can one form have different meanings (ambiguity) but the same meaning can be expressed with different forms:

She gave the book to Tom vs. She gave Tom the book

Some kids popped by vs. A few children visited

Is that window still open? vs. Please close the window

Why is language interpretation hard?

- 1. Ambiguity
- 2. Scale
- 3. Variation
- 4. Sparsity
- 5. Expressivity
- 6. Unmodeled variables
- 7. Unknown representation \mathcal{R}

Unmodeled variables

"Drink this milk"

World knowledge

- I dropped the glass on the floor and it broke
- I dropped the hammer on the glass and it broke

Why is language interpretation hard?

- 1. Ambiguity
- 2. Scale
- 3. Variation
- 4. Sparsity
- 5. Expressivity
- 6. Unmodeled variables
- 7. Unknown representation \mathcal{R}

Unknown representation

- Very difficult to capture what is \mathcal{R} , since we don't even know how to represent the knowledge a human has/needs:
 - What is the "meaning" of a word or sentence?
 - How to model context?
 - Other general knowledge?

Dealing with ambiguity

- How can we model ambiguity and choose the correct analysis in context?
 - non-probabilistic methods (FSMs for morphology, CKY parsers for syntax) return *all possible analyses*.
 - probabilistic models (HMMs for part-of-speech tagging, PCFGs for syntax) and algorithms (Viterbi, probabilistic CKY) return *the best possible analysis*, i.e., the most probable one according to the model
 - Neural networks, pretrained language models now provide end-to-end solutions

• But the "best" analysis is only good if our probabilities are accurate. Where do they come from?

Corpora

- A corpus is a collection of text
 - Often annotated in some way
 - Sometimes just lots of text
- Examples
 - Penn Treebank: 1M words of parsed WSJ
 - Canadian Hansards: 10M+ words of aligned French / English sentences
 - Yelp reviews
 - The Web: billions of words of who knows what

Desiderata for NLP models

- Sensitivity to a wide range of phenomena and constraints in human language
- Generality across languages, modalities, genres, styles
- Strong formal guarantees (e.g., convergence, statistical efficiency, consistency)
- High accuracy when judged against expert annotations or test data
- Ethical

OPENAI'S LATEST BREAKTHROUGH IS ASTONISHINGLY Powerful, but still fighting its flaws

The ultimate autocomplete

By James Vincent | Jul 30, 2020, 10:01am EDT

Q: How many eyes does a giraffe have?
A: A giraffe has two eyes.

Q: How many eyes does my foot have? A: Your foot has two eyes.

Q: Which is heavier, a mouse or a toaster? A: A toaster is heavier than a mouse.

Q: Which is heavier, a toaster or a pencil? A: A pencil is heavier than a toaster.

OpenAl's new language generator GPT-3 is shockingly good—and completely mindless

The Al is the largest language model ever created and can generate amazing human-like text on demand but won't bring us closer to true intelligence.

by Will Douglas Heaven

July 20, 2020

https://lacker.io/ai/2020/07/06/giving-gpt-3-a-turing-test.html

Where are we now? GPT-3 Turing Test

This gives us a hint for how to stump the AI more consistently. We need to ask questions that no normal human would ever talk about.

Q: How many eyes does a giraffe have? A: A giraffe has two eyes.

Q: How many eyes does my foot have? A: Your foot has two eyes.

Q: How many eyes does a spider have? A: A spider has eight eyes.

Q: How many eyes does the sun have? A: The sun has one eye.

Q: How many eyes does a blade of grass have? A: A blade of grass has one eye.

https://lacker.io/ai/2020/07/06/giving-gpt-3-a-turing-test.html

GPT-3 Turing Test

Now we're getting into surreal territory. GPT-3 knows how to have a normal conversation. It doesn't quite know how to say "Wait a moment... your question is nonsense." It also doesn't know how to say "I don't know."

```
Q: How do you sporgle a morgle?
```

- A: You sporgle a morgle by using a sporgle.
- Q: How many bonks are in a quoit? A: There are three bonks in a quoit.

Q: How many rainbows does it take to jump from Hawaii to seventeen? A: It takes two rainbows to jump from Hawaii to seventeen.

Q: Which colorless green ideas sleep furiously? A: Ideas that are colorless, green, and sleep furiously are the ideas of a sleep furiously.

- Q: Do you understand these questions?
- A: I understand these questions.

Where are we now? GPT-3 Turing Test

One trend that continues from the common sense is that GPT-3 is reluctant to express that it doesn't know the answer. So invalid questions get wrong answers.

Q: Who was president of the United States in 1700? A: William Penn was president of the United States in 1700.

Q: Who was president of the United States in 1650?

A: Richard Bennett was president of the United States in 1650.

Q: Who was president of the United States in 1620?

A: James I was president of the United States in 1620.

Q: Who was president of the United States in 1600? A: Queen Elizabeth I was president of the United States in 1600.

https://lacker.io/ai/2020/07/06/giving-gpt-3-a-turing-test.html

Where are we now? GPT-3

An interesting corollary is that GPT-3 often finds it easier to write code to solve a programming problem, than to solve the problem on one example input:

Q: Write one line of Ruby code to reverse an array. A: ary.reverse

Q: Write one line of Ruby code to count how many X's are in an array. A: ary.count { |x| x == 'X' }

Q: Reverse the following array: [1, 3, 5, 6, 10, 4, 2, 77] A: [10, 6, 4, 2, 77, 3, 5, 1]

Q: How many X's are in this array: [1, 3, 5, 6, 10, 4, 2, 77] A: 2

Where are we now? Meena \rightarrow LaMDA

Conversation A

Human:	say you're in an empty giant office and you see
Meena:	a black bird flying indoors. what do you do? What kind of bird? Is it friendly? How large? How big is the office? Is it indoors or outdoors?
Human: Meena:	well it's a predator bird and it's gonna eat you I would grab my phone and call 911.

Human: I've been using Python for 15 years Meena: Ah I see, so I'm guessing you're pretty pro at it by now then? Human: probably Meena: What's your current project? Human: NLP Meena: Neuro-linguistic Programming? Human: correct

~	Cross-turn Repetition Example 1
Human:	Hi!
Meena:	Hi! How are you?! :)
Human:	doing good, what would be the best city to visit
	in Europe?
Meena:	Paris, Barcelona, Amsterdam, Prague
Human:	great list! why?
Meena:	Paris is a beautiful city, and Barcelona is too.
	And I've always wanted to go to Amsterdam and
	Prague and have never been.
Human:	have you even been to India?
Meena:	No, but I'd love to go.
Human:	how about Japan?
Meena:	I'd love to go to Japan too.
Human:	how about Paris?
Meena:	I'd love to go to Paris too.
Human:	are you lying to me?
Meena:	I'd love to go to Japan too.
Human:	i think you're lying to me, that makes me sad
Meena:	I'd love to go to Japan, too.
Human:	you're blocking me out! you have to talk to me
Meena:	I'd love to go to Japan.
Human:	where else?
Meena:	I'd love to go to Japan, too!

What can we do about this problem? We'll discuss in NLP class!

NLP - Machine Learning

- To be successful, a machine learner needs bias/assumptions; for NLP, that might be linguistic theory/representations.
- Symbolic, probabilistic, and connectionist ML have all seen NLP as a source of inspiring applications.

What is nearby NLP?

- Computational Linguistics
 - Using computational methods to learn more about how language wor
 - We end up doing this and using it

Cognitive Science

- Figuring out how the human brain works
- Includes the bits that do language
- Humans: the only working NLP prototype!

Speech Processing

- Mapping audio signals to text
- Traditionally separate from NLP, converging?
- Two components: acoustic models and language models
- Language models in the domain of stat NLP
